ROTARY RAKES
HYDRAULIC LIFT
Pull type

Warranty

SITREX s.r.l. warrants new SITREX machinery to be free from defects in material and workmanship at the time of delivery to the original purchaser if correctly set up and operated according to this Operator's Handbook.

SITREX undertakes to repair or replace free of charge any defective part which should be returned by the purchaser (freight prepaid) and found to be defective on inspection authorised by SITREX during the warranty period.

This warranty shall be valid for 12 (twelve) months from the delivery of the goods to the original purchaser.

If the customer is unable to return the defective part to the manufacturer, the manufacturer cannot be held responsible for any cost due for repair or replacement of any part of the machine. He shall only supply the part(s) required for such repair and/or replacement.

The warranty shall be considered null and void when it is evident that the machine has been improperly used or at least repaired without authorisation.

SITREX shall not be held responsible for any obligation or agreement reached by any SITREX employers, agents or dealers who do not comply with the above warranty. The manufacturer cannot be held responsible for the subsequent damages. This warranty replaces any other warranty, either explicit or implied, as well as any other obligation of the manufacturer.

GUIDE TO THE SIGNS AND SYMBOLS USED THIS MANUAL AND THEI LOCATION ON THE MACHINE

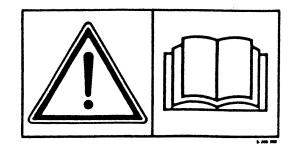

IMPORTANT

These signs and symbols give information to the operator on how to make the best use of the machine so as to prolong life, avoid damage, optimise work and, above all, to avoid injury to the operator and anyone within range of the machine.

WARNING SIGNS

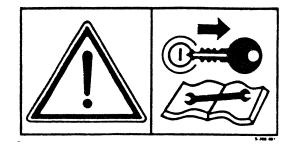

1

Before beginning operations, read the instruction manual carefully.

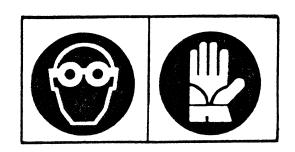

2

Before undertaking any maintenance, stop the machine and support it on the ground. Then consult the instruction manual.

3

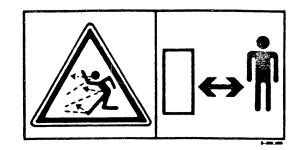

This is a warning to use proper accident protection when carrying out maintenance and repairs

DANGER SIGNS

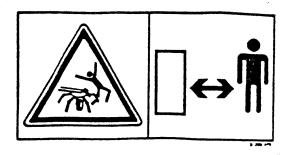

4

Risk of possible ejection of blunt objects. Keep a safe distance from the machine.

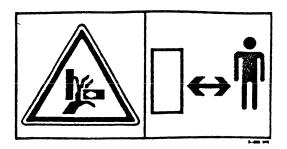

5

Indicates that anyone coming within range of the moving tine arms will be seriously injured. Keep a safe distance from the machine.

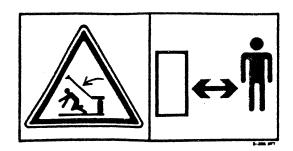

6

Indicates that there is a risk of crushing your hands. Keep your distance.

7

Indicates danger caused by accidental fall of suspended arms. Keep safe distance.

8

Indicates that it is dangerous to touch the Cardan (P.T.O.) shaft.

For all the other infomation regarding the Cardan (P.T.O.) shaft, see the use-and-maintenance booklet specifically for the Cardan (P.T.O.) shaft which, together with this manual, makes up the documentation on safety, use and maintenance of the machine.

INDICATION SIGNS

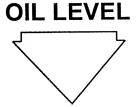

9 Indicates a greasing point.

Shows the direction of rotation of the power takeoff and the maximum number of revolutions.

11 Indicate a oil point.

GENERAL SUMMARY OF SAFETY AND ACCIDENT PREVENTION INSTRUCTIONS

Read all the instructions carefully before using the machine. When in doubt seek advice from the manufacturing company.

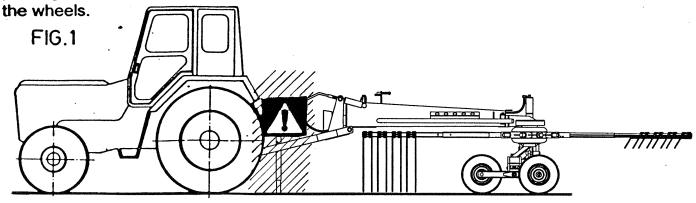

The manufacturing company declines all responsibility for non-compliance with the following safety and accident prevention instructions.

- 1. Pay attention to the danger signs and symbols in this manual and on the machine.
- 2. Do not touch moving parts.
- 3. All work on the machine (including adjustments) must always be carried out with the tractor immobilised and the engine switched off.
- 4. On no account may persons or animals be carried on the machine.
- 5. Driving the tractor with the machine connected is absolutely forbidden to persons lacking suitable experience, or who are in poor health, or who are too young or do not have a suitable driving licence if travelling on the highway.
- All accident prevention measures recommended in this manual should be scrupulously observed.
- 7. Connecting the machine to the tractor creates a different weight distribution on the tractor axles and so it is essential to ensure that the tractor-machine combination is stable in all anticipated working condition. It is therefore necessary to have exact instructions from the tractor manufacturers. If such instructions are not available, suitable tests should be conducted in safe conditions in order to assess stability.

- 8. Once the machine is connected it can only be controlled through a Cardan (P.T.O.) shaft complete with the required overload protection and guard secured with the appropriate small chains. Be aware of the rotational direction of the Cardan (P.T.O.) shaft.
- 9. Before operating the tractor and machine, check that all transport and operational safety devices are complete and working.
- 10. When driving on public roads, you should comply with the highway code regulations for the country concerned.
- 11. Do not exceed the tractor axle maximum weight and the total mobile weight.
- 12. Before starting work, familiarise yourself with the control devices and how they work.
- 13. Wear suitable clothes. Do not wear clothing which is loose or which could become entangled in rotating or moving parts.
- 14. Connect the machine to a suitably powerful tractor by using an appropriate lifting unit and in accordance with instructions.
- 15. Take maximum care when connecting and disconnecting the machine to and from the tractor.

- **16.** The machine and any road transport attachments must bear the appropriate signs and symbols and have suitable protection.
- 17. Never leave the driving seat when the tractor is running.
- 18. It is extremely important to appreciate that road-holding, steering and braking may be significantly affected with the machine attached.
- 19. When turning corners with the machine attached, be aware of the fact that the centrifugal force will alter due to the change in the centre of gravity.
- 20. Before engaging the power takeoff, check the pre-set revolution speed, MAXIMUM 540rpm. Do not use 1000rpm drive.
- 21. Under no circumstances should anybody stand near the machine or any moving parts. It is the duty of the operator to ensure that this requirement is respected.
- 22. Before leaving the tractor, lower the machine with the lifting unit, stop the engine, apply the parking brake and remove the ignition key from the instrument panel.
- 23. Under no circumstances should anybody go between the tractor and the machine (Fig.1) when the engine is running and the Cardan (P.T.O.) shaft is engaged, especially without first having applied the parking brake and placed chocks against

- 24. Before connecting or disconnecting the machine to or from the 3-point linkage, put the lifting unit lever into the locked position.
- 25. The connection pins on the machine must match the connection sockets on the lifting unit.
- 26. During transport, stop machine sway, secure the lower lift arms with the stabilisers or check chains.
- 27. When the machine is raised during road transport, put the tractor's hydraulic lift control lever into the locked position.
- 28. Only use the Cardan (P.T.O.) shaft provided by the manufacturer and, in case of replacement, substitute it with one having the same characteristics.
- 29. Regularly check all protection guards on the Cardan (P.T.O.) shaft. These should always be in excellent condition and securely fixed.
- 30. It is important to ensure that the protection on the Cardan (P.T.O.) shaft is complete.
- 31. Connection and disconnection of the Cardan (P.T.O.) shaft must be carried out with the engine stopped and switched off.
- 32. Pay particular attention to the correct connection and safety of the Cardan (P.T.O.) shaft and the power takeoffs on the machine and the tractor.

- 33. Prevent the Cardan (P.T.O.) shaft protection from rotating using the chains supplied.
- 34. Before engaging the power takeoff, make sure that there are no people or animals in the vicinity and that the selected engine speed corresponds to the Cardan (P.T.O.) speed permitted. 540rpm MAXIMUM.
- **35.** Do not engage the power take-off when the engine is not running.
- 36. Always disengage the power take-off when the Cardan (P.T.O.) shaft is at too wide an angle (it should never be more than 35° Fig.2) and when it is not in use.

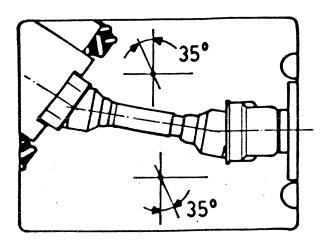

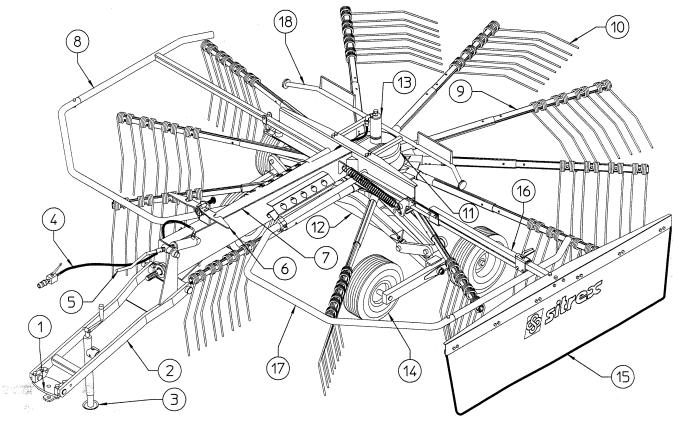

FIG. 2

- 37. Only clean and grease the Cardan (P.T.O.) shaft when the power takeoff is disengaged, the engine is off, the parking brake is applied and the ignition key is removed.
- 38. When the Cardan (P.T.O.) shaft is not in use, rest it on the support provided.
- 39. On disconnecting the Cardan (P.T.O.) shaft, replace the protective cover on the power input (gearbox) shaft.

- 40. Prolonged use of the machine can cause the drive boxes (Fig.4) to become hot. To avoid any risk of getting burnt, avoid touching these areas both during use and some time afterwards.
- **41.** Periodically check screws and nuts for tightness and grip. Tighten as necessary.
- **42.** When the machine is raised for maintenance work and tine replacement, put suitable supports under the machine as a safety precaution.
- **43.** Ensure that the recommended grease is used.
- **44.** Spare parts must meet the requirements as defined by the manufacturer. Use only original spare parts.
- 45. Safety decals must always be clearly visible. They must be kept clean and replaced if they become too illegible (they can be ordered from the dealer if necessary).
- **46.** The instruction booklet must be available to all users for the lifetime of the machine.

CHAPTER 4

DELIVERY AND ASSEMBLY

Checking the machine on delivery

All parts are carefully checked before dispacth or delivery.

On receiving the machine, ensure that it has not been damaged during transport. If damage has occurred, contact the dealer concerned.

Details of packing are given below.

UNPACKING THE MACHINE

DANGER III

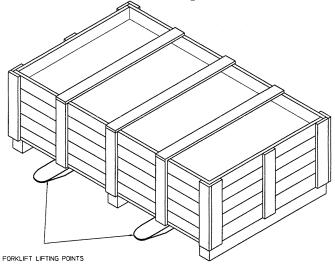

Lift the machine using a forklift truck, crane or other suitable equipment of sufficient capacity after first checking the weight of the configurations in the table given below.

Check the stability and positioning of the load on the forklift truck forks or crane hook.

Keep the load as low as possible during movement for maximum stability and to ensure that the operator has maximum visibility.

If a forklift truck is used, ensure that the forks are positioned as wide apart as possible.

	WEIGT PACKING	WEIGHT
KG	765	
LBS	1700	

The packing consists mainly of wood which should be disposed of NOTE: 1) according to the laws in force in the country where the machine is used.

The plastic film should also be disposed of according to the laws in force in the country where the machine is used.

- When storing, it is permissable to stack 2-3 crates on top of each othe. Make sure that they are perfectly aligned certically.
- In the event of further transport, ensure that the machine iwhen on the transporting vehicle.

ASSEMBLY

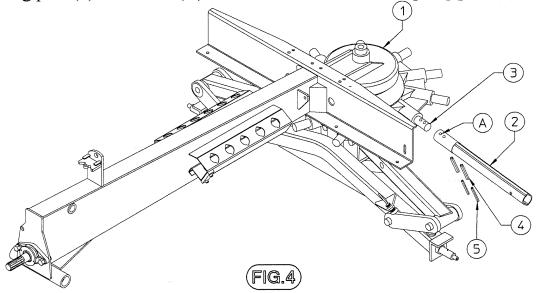

DANGER !!!

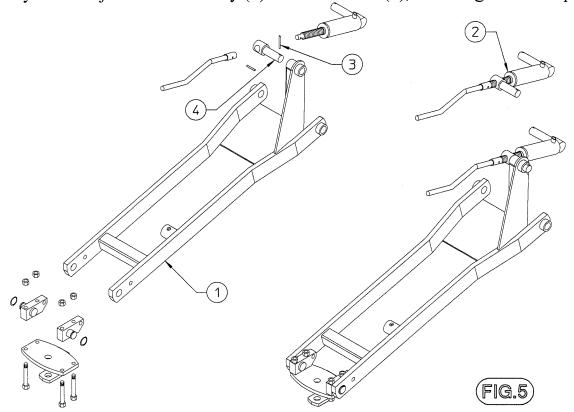

Assembly is highly dangerous and must be carried out in strict accordance with the following instructions. We recommend that assembly be performed by qualified personnel. We also recommend that assembly be carried out in a flat, open area with no people (particularly children) nearby who could be severely injured if they were to touch or move any parts of the machine.

Assembly sequence:

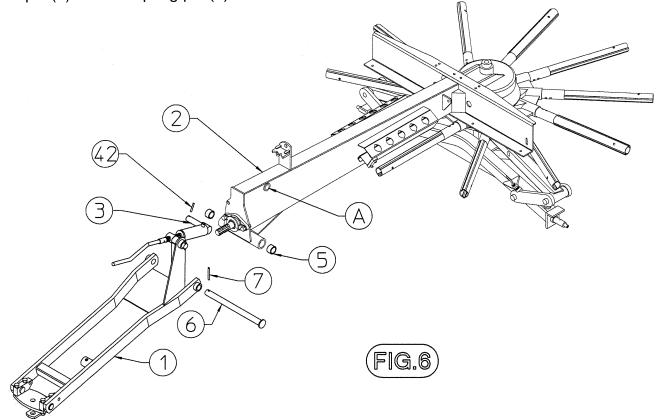

Attach the arms (2) to the housing (1), placing them over the pins (3). Fasten the arms by inserting spring pins (4) into holes (A), and then insert the inside spring pins (5).

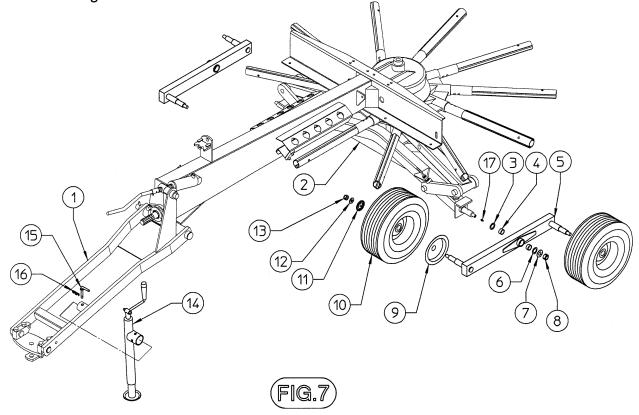

Attach the cylinder-adjustment assembly (2) to the drawbar (1), fastening with the spring pin

Rest the main frame (2) on stands and then insert the wear bushings (5). Insert pin (3) into hole (A) and fasten with the spring pin (42). Position the drawbar (1) so that pin (6) can be inserted, and fasten pin (6) with the spring pin (7).

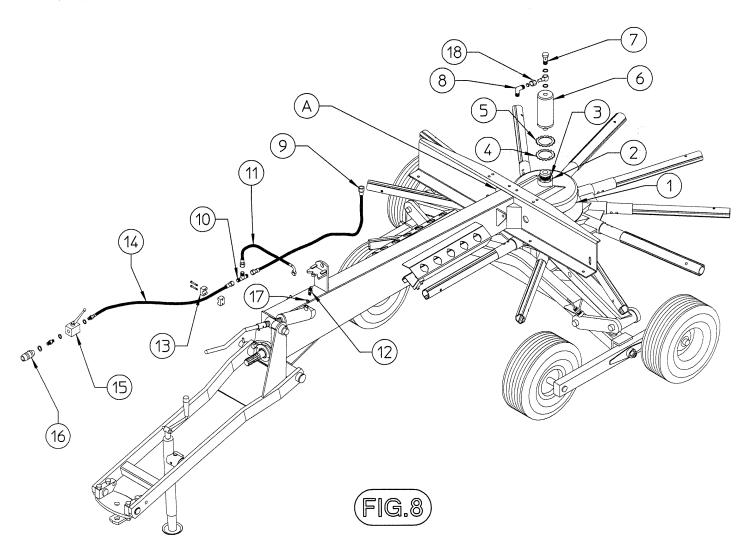

Attach grease nipples (17) to the axle (2). Next check to see that the wear bushings are in place on the wheel tandems (5), and mount the tandems on the axles, inserting spacers (3) and (6), in order to limit play (the longer part of the wheel tandem should face the tractor), and fasten with the washer (7) and nut (8). Mount wheels (10) on the tandem pins, first placing the large guard (9) and then the small guard (11), the washer (12) and tighten with the nut (13). Mount the parking stand (14) to the mount on the drawbar (1), and fasten with pin (15) and clip (16). The machine can now be placed on the ground.

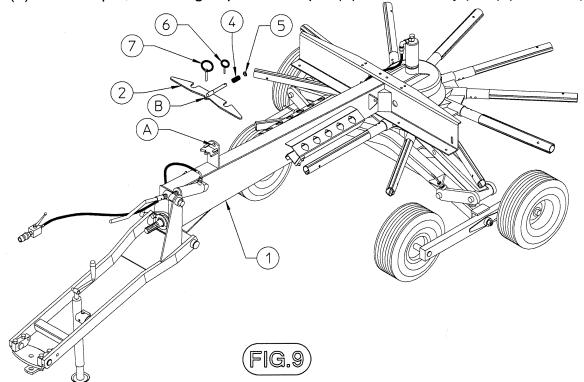

HYDRAULIC SYSTEM ASSEMBLY

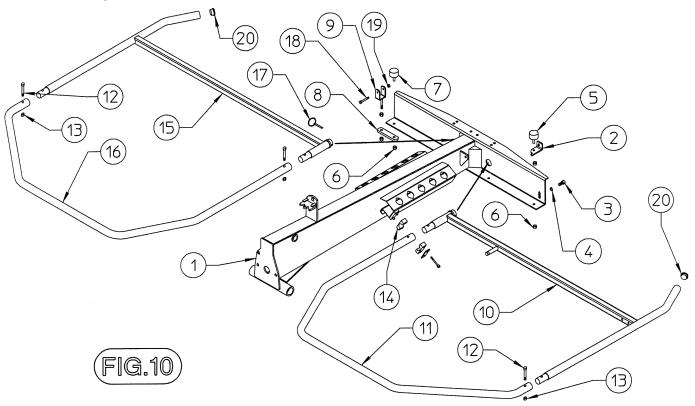

Remove the guard on the central screw of the housing (1), then screw on the cylinder (6), without touching the ring (2) or the lower toothed washer (4). When the cylinder is tight, bend one of the tabs of the upper toothed washer (5) on the milled part of the cylinder so as to fasten it. Loosen screw (7) and turn the curve (8) towards the tractor hitch, then tighten screw (7) and nut (18). While doing this operation, the barrel of the cylinder could be loosened from the head ring, so check at the end of the operation to make sure that it is tight. Attach the hydraulic line (9), which can be recognized by the inner gasket on the curve (8), passing it through hole (A). Next attach the T connector (10) with lines (11) and (14), and fasten the lines into the working position using the three line clamps (13), without pulling the lines tight; in the area where the main frame is joined to the drawbar, the line must make an arch, so as to allow movement between the two parts. Check carefully to make sure that the opening of the tilt adjustment cylinder does not pull on line (14). If it does, lengthen the loose section between the two line clamps (13) that hold the lines in this area. The short line (11) feeds the tilt adjustment cylinder and is attached by means of the nipple (12) and washer (17). Attach the tap (15) and quick-release coupling (16) to the end of line (14).

Mount the safety hook (2) by inserting it into hole (A), and then place the spring (4) and washer (5) over the pin, fastening in place with pin (6). Insert safety pin (7) in hole (B).

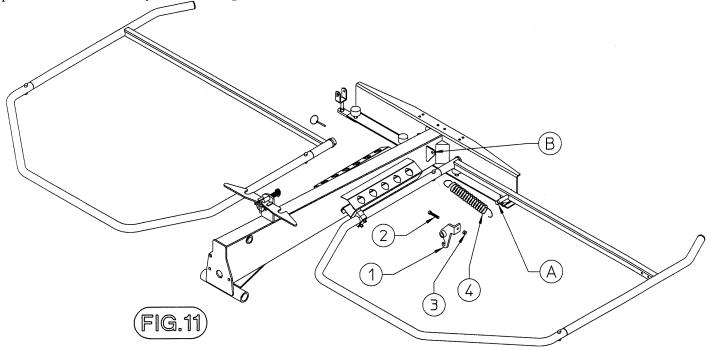

ATTENTION: Mount the high rubber pad (7) to the right outside hole with nuts (6), taking also the plate (8); in the other holes the low rubber pads (5), in the left outside hole fasten also clamp (2) with screw (3) and washer (4). Mount protection frame (11) to the left support (10) using screws (12) and nuts (13), then insert the assembly into the hole as shown in the illustration, fastening the protection frame with pin (17) and clamp (14), and attach cap (20) to the end of the protection frame. Mount bracket (9) to the plate (8) and then mount protection frame (16) to the right support (15) and insert the assembly into the hole, following the same procedure used for the left side of the machine.

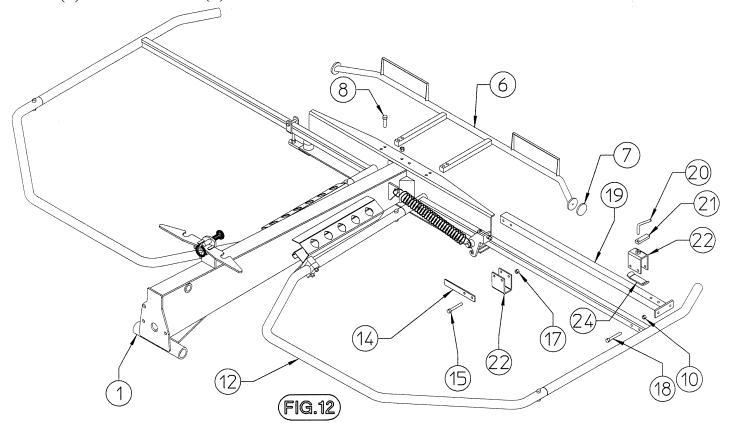

Mount safety hook (1) on to the pin (A) welded on to the frame, mount on safety hook the screw (2) and nut (3). Mount spring (4) to help suspension between the pin and the plate welded on the drawbar (see following diagram).

Adjust screws (M10 x 60 fully threaded) so that the safety hook turns partially and is positioned vertically when the protection frame is horizontal.

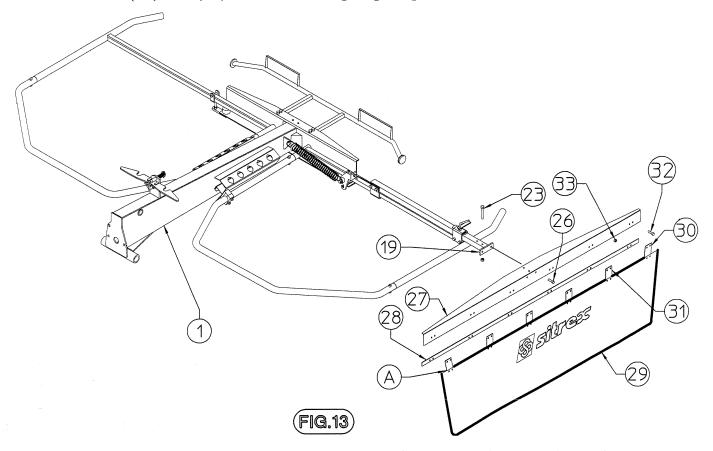

Use brackets (22), screws (18) and (15) and nut (10) to mount plate carrier extension (19) on to the left-hand protection frame. Also mount plate (14) on the outside of the internal bracket, whereas plate (24) must be mounted on the inside of the external bracket. In order to fasten the extension tighten screw (20) and lock (21). Use screws (8) to mount signal frame (6) on to the frame (1).

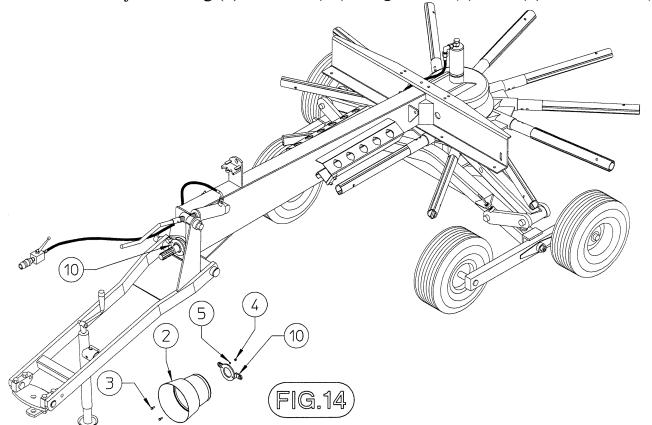

In order to mount swathing deflector (29) insert the slanting metal tabs (30) into the external slots and the straight tabs into the central slots, and then rest the swathing deflector on the inside of side frame (27) and place plate (28) on the outside; use screws (32) and nuts (33) to fasten everything into place.

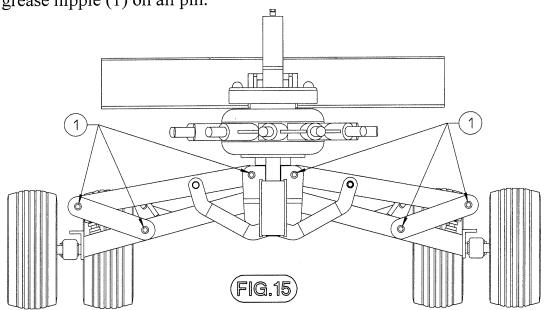

Now use screws (23) and (26) to mount this group on plate carrier extension (19).

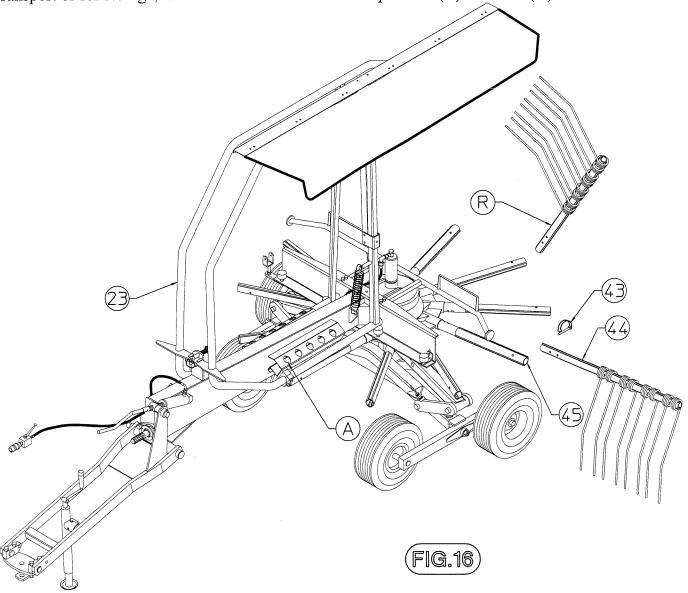

Attach the universal joint casing (2) to mount (10) using screws (3), nuts (4) and washers (5).

Mount the grease nipple (1) on all pin.

Before assembling the rake arms, raise the protection frames and use hook 23 to hold them up. If the machine has to be set up for work, mount detachable arms 44 on to the fixed arms 45 and fasten them with pin 43; the two holes on the detachable arms are to adjust swath width. The maximum working width is obtained by assembling the arm on the innermost hole. If the machine has to be prepared for transport or for storage, mount the detachable arms in position (R) in holes (A) on the frame.

CHAPTER 5 ADJUSTMENT, PREPARATION AND USE INTRODUCTION

DANGER III 🛕

Connection to the tractor is higly dangerous. Take great care and carry out the entire operation in strict compliance with the following instruction.

Nobody should go near the area between the tractor and the machine.

Check that all warning and danger signs are in place and legible.

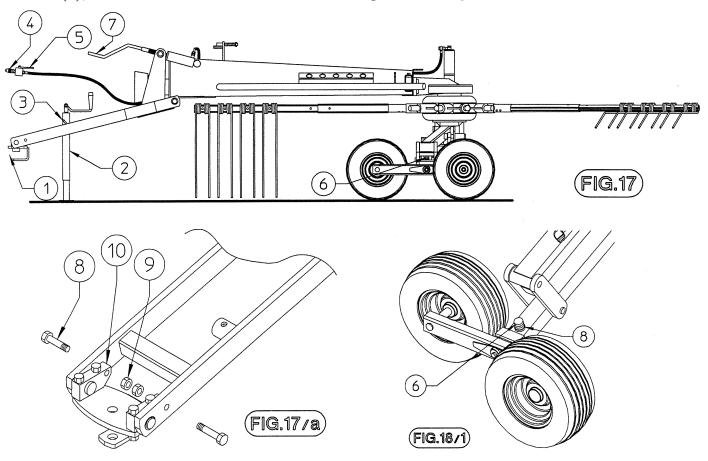

Check that the tractor is in good running order. Check the engine oil, gerbox oil, brake fluid and cooling water levels as well as the tyre pressures.

Refer to the tractor operator's manual.

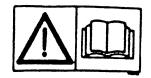

CONNECTION TO THE TRACTOR

Connect the machine to the tractor, hitching it to the drawbar bar at point (1). If the twopoint crosspiece is used, lock the equalizers (10) using the optional screws (8) and nuts (9). Attention: do not use screws (8) if the machine is hitched to the drawbar. After the machine is hitched, loosen the parking stand (2) and remove pin (3), then rotate the stand upward towards the back of the machine and insert pin (3) to hold it in the resting position.

Once this procedure is completed, insert the quick-release coupling (4) into the tractor socket and open the tap (the lever must be parallel with the line, as shown in the illustration). At this point, work carefully with the hydraulic distributor to make sure that the frame is completely lowered, then adjust the height of the tines above the ground. To change the distance between the tines and the ground, turn screws (6). By rotating the crank (7), the tilt of the machine relative to the ground is adjusted.

DANGER!!!

More detailed information may be found in the Cardan shaft manual which, together with this manual, is an essential part of the accident-prevention documentation. It is your responsibility to read and comply with this documentation. If information given in this manual should conflict with that given in the Cardan shaft manual, you should follow the instructions given by the Cardan shaft manufacturer.

! DANGER!!!

Fit the Cardan shaft and check that the shaft is connected correctly both at the tractor end and at the machine end. For more details, 500 descriptions on the following pages.

is If safety system provided, this should be fitted to the machine end, not to the tractor end.

During both transport and use, avoid conditions where the Cardan transmission shaft is extended to the maximum. all working conditions, telescopic tubes must overlap least 1/3 of their by at length (Fig.1).

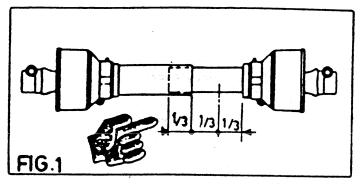

Conversely, when the Cardan shaft is contracted to the maximum, there should still be FIG.2 of approximately gap

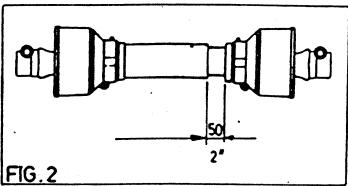

50 mm (2") (Fig.2).

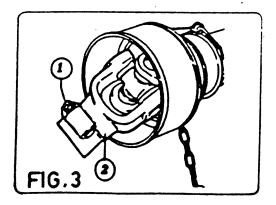

Take particular care when connecting the two Cardan shaft end forks and make sure that they are fully secured.

This is achieved by inserting the safety pins and bolts (1) (Fig. 3.) in the special slots(2)on the power takeoff shafts on both the tractor and machine ends.

A loose shaft could come apart and cause considerable mechanical damage and serious injury to persons.

DISASSEMBLY OF THE TRACTOR

In order to park the rake, make sure that the ground beneath it is flat and is able to bear the weight of the machine.

When the rake is raised and lowered, no-one should be standing between the tractor and the machine or near the machine.

Before disconnecting the machine from the tractor, use the hydraulic system to lower the machine completely, then apply the brake and shut off the tractor. Dismount from the tractor and place the parking stand in the vertical position (pos. 2, Fig. 18). Turn the crank to raise the machine from the drawbar so that the hitch pin may be removed from the tractor. Disconnect the quick-release coupling (4). Disconnect the cardan shaft and lay it against the parking stand crank. The tractor may now be moved away.

If there are problems with space, when not in use the machine may be left in the position shown in Fig. 16.

Attention: the machine should be in the high position only when being transported.

ADJUSTMENT OF THE FORAGE RAKE

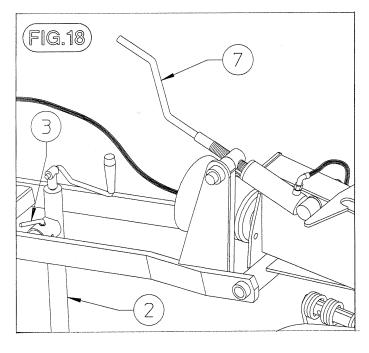

The machine has to be adjusted when it is attached to the tractor.

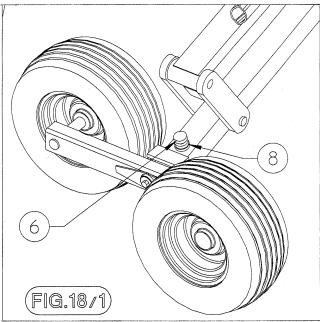

Adjustment of work depth

Adjustment of working height

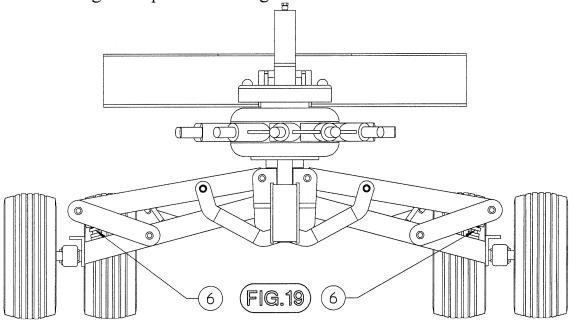

The working height is adjusted by turning screws (6) and nut (8) and by rotating crank (7); it is advised to adjust the front tine so that it is 1 3/8" from the ground, and to keep the machine tilted slightly towards the front. The rear tine should be about 3/16" farther away from the ground.

If adjustment is too high, the forage will not be completely picked up and if it is too low, the forage risks becoming dirty, the grass will be damaged and the double elastic tines will be worn down.

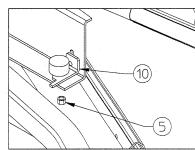

When the working height is being adjusted, set the screws (6) and relative nuts (8) so that the machine as seen in Fig. 19 is parallel to the ground.

After having adjusted the work height of the tine, use nuts 5 under clamp 10 to set the distance of the plate from the ground.

The distance between the swath-shaper plate and the rotor determines the size of the swath and on this depends the amount of forage. Adjustment is continuous and a large amount of

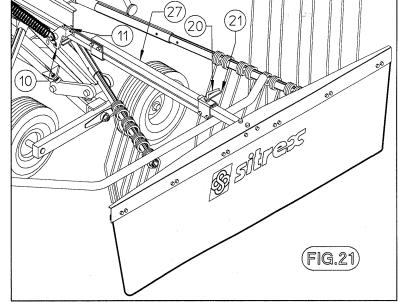

forage means making a larger adjustment. In order to carry out adjustment, loosen lock 21 and screw 20 and then move plate carrier 27 to the required position and tighten first screw 20 and then lock 21.

In the work position check that safety hook 13 fits into lock 10 in order to fasten

the swath-shaper plate into position. Adjustment of gear speed and revs to work the machine

The gear speed and machine revs depend on;

- the amount of forage
- the type of ground
- the degree of dryness

The forage rake was designed for a maximum number of revs for the power take-off of 540 g/min. We advise working with a rev number of 350-450 g/min. Gear speed should be limited so that the rake works cleanly and the swath is well formed.

TRANSPORT

If the machine is used on the road, make sure it complies with traffic regulations in your country; use regulation lights and comply with the safety regulations.

Preparation for transport

The machine may be transported for short distances after having raised it with the hydraulic system. When transporting for longer distances, close the tap (5). This operation must be done regardless of distance when transporting on public roads. When lifting the machine, make sure that the outside arms (1) move all the way until they touch the stops (2).

During transport or storage it may be necessary to have the machine occupy less space. To do this, follow the procedure given below (see Fig. 16).

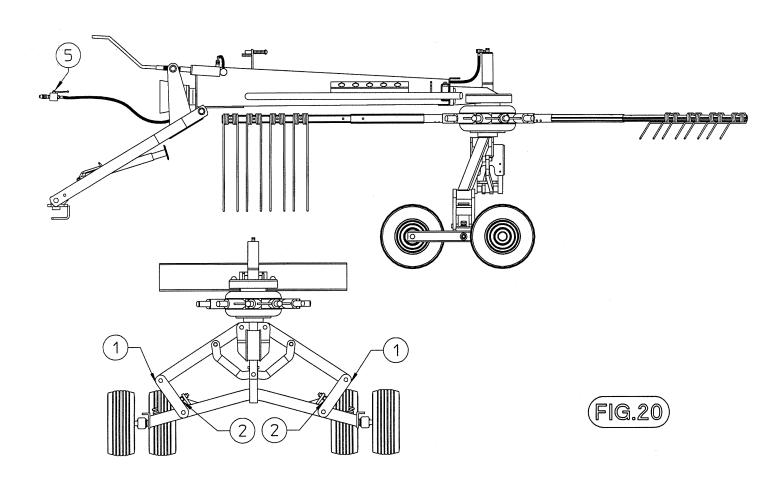

Loosen the swath-shaper plate carrier and reinsert it until the safety hook is released, then tighten the lock screw once again.

Turn the protection frames facing upwards one at a time and use hook 23 to fasten them, insert safety clamp 24 into the special slot.

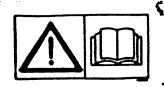

Remove tine carrier arms 44 from their slots and take out lock clamps 43, insert the arms into the special slots on side frame 1; the arms should be inserted with the tines facing into the machine. Clamps 43 should be placed into the holes on the rotor arms.

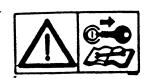

By detaching the arms and lifting up the protection frames, it is possible to have a narrower width if necessary for transport; the machine itself does not require these operations.

Remember to open the tap and lower the machine after transport operations are completed.

MAINTENANCE DIRECTIONS

DANGER III

All cleaning, lubrication and maintenance operations must be carried out with the machine disconnected from the tractor. In an emergency with the machine still connected to the tractor, switch off the engine, apply the parking brake, disengage the power takeoff and remove the ignition key from the instrument panel.

Regular, correct maintenance and proper operation are the basic prerequisites for the long-term efficiency and safe operation of the machine.

Pay special attention to all instructions given on signs located on the machine.

All maintenance should be carried out in an area having the proper equipment readily available and in good condition. This area must always be kept clean and dry and must have enough surrounding space to facilitate operations.

Any work must be carried out by trained personnel. Contact

the dealer nearest to you.

Respect the warnings and procedures for maintenance and technical assistance given in this manual.

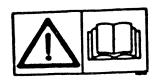

Do not use petrol, solvents or other flammable liquids as detergents.

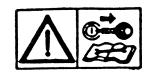

Use commercial non-flammable and non-toxic solvents,

authorised by competent bodies.

Do not use compressed air or water at high pressure to clean the machine. If this is unavoidable, then wear goggles with side protection and limit the pressure as much as possible. When the work is finished, and with the machine disconnected from the tractor, inspect and check the machine completely.

GENERAL INSTRUCTIONS FOR REPAIR WORK

DANGER III

Any repair work must be carried out with the machine at rest and disconnected from the tractor.

Do not carry out welding without authorisation and instructions from the manufacturers.

Disconnect the machine from the tractor before any welding work in order not to damage the battery. Always use a protective mask, goggles and gloves when welding, sanding or grinding or when using a hammer or drill.

Always work on the machine out of doors. If you have to operate the machine when connected to the tractor in an enclosed area (for example when testing after repair and/or maintenance), ensure that there is sufficient ventilation so as to prevent noxious exhaust gases accumulating.

In order to acquire the necessary control and to operate in safety, practise various manoeuvres by simulating those required in the workplace with the help of an experienced person.

If you activate the machine while it is raised from the ground, make sure there is nobody standing nearby or in a dangerous position.

LAYING UP FOR EXTENDED PERIODS

At the end of the season, or when an extended period of inactivity is envisaged, it is advisable to:

Clean the machine following instructions and allow it to dry.

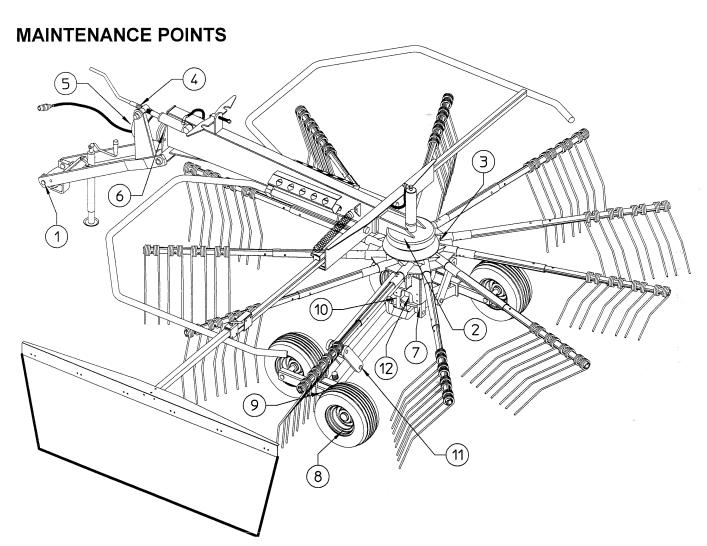

Check it carefully and replace any damaged or worn parts.

Thoroughly tighten all screws and bolts.

Grease the machine thoroughly and then cover it completely and lay it up in a dry place.

It is to the user's advantage to carry out these operations carefully. In this way, he will have a machine in perfect condition when work is restarted.

On recommencing work, repeat all the proper checks so as to be certain of working in conditions of maximum safety.

Number	Q.ty	Description	Operation	Every hours	Product to be used	Notes

10	1	Sliding	Cleaning	В	Grease	
			Greasing			
11	6	Pin	Greasing	8	Grease	
12	1	Rod (210.680)	Greasing	8	Grease	
	2	Cardan shaft	Greasing	8	Grease	

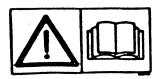

General checking of bolts, security pins and split pins to be carried out initially after the first 8 hours of use. Subsequently every 50 hours and whenever the machine is laid up for extended periods.

A = Each time the Cardan shaft is disconnected and Whenever the machine is stopped, we recommended that you clean the power takeoff shaft and replace the protective cover.

B = Each time the machine is connected to the tractor.

[#] Additives of a type permitted by anti-pollution regulations.

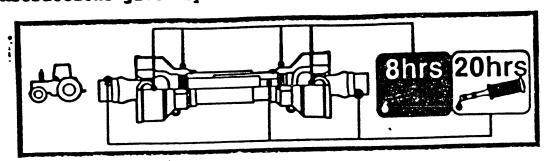

CARDAN SHAFT MAINTENANCE

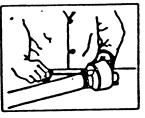

More detailed information may be found in the Cardan shaft manual which, together with this manual, forms an essential part of the accident-prevention documentation. responsibility to read and comply with this documentation. If information given in this manual conflicts with that given Cardan shaft manual, you should follow instructions given by the Cardan shaft manufacturer.

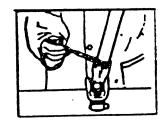

MAINTENANCE OF SLIDING PARTS

DISMANTLING

1) Turn the two eccentric pins on the ferrule until the protective cone comes free.

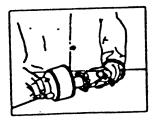

4) Lubricate supporting ferrule seating.

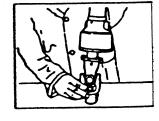

ASSEMBLY

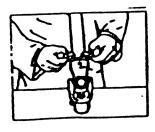

2) Withdraw the shaft protective guard.

5) Refit the supporting ferrule.

3) Check the condition of the ferrule and all protective parts.

6) Reattach the protective guard to the cardan shaft by turning the eccentric pins on the supporting femule.

NOISE AND VIBRATION

Noise affecting the tractor driver (from the machine only) is less than 70dB.

Vibration from the machine affetcing the upper body and limbs of the driver is insignificant and is lower than the values given in Point 3.6.3 of Enclosure 1 of the Machine Directives (89/392/EEC, 91/386/EEC)

THE FOLLOWING SHOULD BE NOTED IF THE MACHINE IS SCRAPPED

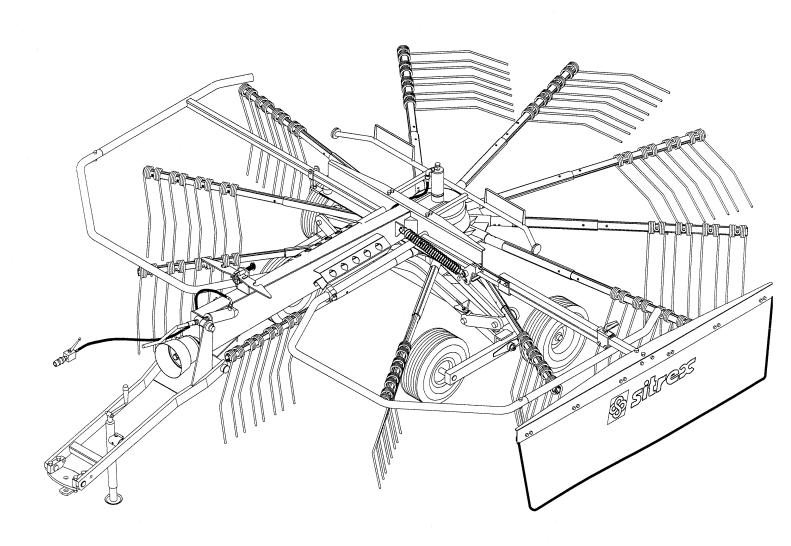

The machine consists mainly of ferrous material which must be disposed of according to the regulations in force in the country concerned.

There is also a small amount of plastic which must be disposed of according to the regulations in force in the country concerned.

There is very small amount of residual grease which must be disposed of according to the regulations in force in the country concerned.

SPECIFICATIONS	420/11
Number of arms	11
Number of double tines per arm	4
Working width	4,20 / 13'-9"
Rotor diameter (raking width)	3,40 / 11'-2"
Transport width (with arms disassembled)	2,00 / 6'-7"
Transport width (with arms assembled)	3,50 / 11'-5"
Maximum height of tine from ground	0,33 / 1'-1"
Power required	30kW / 40HP
PTO driveline with overload clutch	540 RPM constant velocity
	overload clutch protects gearbox
Hydraulic requirement	1,000 PSI
Weight	700kg / 1550lbs
Tyres (tandem axle)	18 x 8.50 x 8
